20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This is the first part of a planned Northern Hemisphere atlas of prob- abilities of cloud-free lines-of-sight between the earth and space, and the earth and an altitude of 2500 m (8200 ft). The probabilities are for the mid- season months—January, April, July, and October; four times of the day— 0000-0200 LST, 0600-0800 LST, 1200-1400 LST, and 1800-2000 LST; and four elevation angles—10°, 30°, 50°, and 90°.

Atlas of Cloud-Free Line-of-Sight Probabilities

Part 1: Germany

1. INTRODUCTION

The increased use of optical, infrared, and microwave observing and transmitting devices has resulted in a greater demand for information on humidity, haze, clouds, and precipitation. The Air Force Cambridge Research Laboratories (AFCRL) Design Climatology Branch (LKI), Hanscom AFB, MA 01731, and the USAF Environmental Technical Applications Center (ETAC)*, Scott AFB, Illinois 62225 have responded to this demand by collecting special observations, developing models for estimating the desired information in the absence of direct observations, and processing vast quantities of data.

One of the items frequently requested is information on the probability of a cloud-free line-of-sight (CFLOS) between a specific point on the surface of the earth and an aircraft or an object in space. A large volume of data has been processed in response to these requests.

AFCRL and ETAC are endeavoring to prepare a Northern Hemisphere atlas from these data. Because this is a very time-consuming effort, we have decided to prepare this atlas in sections as data become available. This first section, Germany, is a very small part of the entire effort.

(Received for publication 8 May 1975)

*Department of Defense organizations and contractors are encouraged to contact AFCRL or ETAC for further information on line-of-sight probabilities. Probabilities as a function of altitude and persistence, recurrence and joint probabilities are also available.

Preceding page blank

2. THE MODEL

Lund and Shanklin¹ developed models for estimating probabilities of CFLOS through the atmosphere at any desired elevation angle and geographical location. The models require a knowledge of sky-cover climatology for the locations.

The model used to estimate CFLOS probabilities through the entire atmosphere can be expressed as follows:

$${}_{\alpha}\hat{P}_1 = {}_{\alpha}C_s K_1 \quad (1)$$

where ${}_{\alpha}\hat{P}_1$ is a column vector of α rows, one row for each angle considered; ${}_{\alpha}C_s$ is a matrix of α rows and s columns, one column for each sky cover category; and ${}_sK_1$ is a column vector of s rows. The \hat{P} values are estimates of CFLOS probabilities, the C values are CFLOS probabilities at angles α given k tenths of cloudiness, and the K values are probabilities of each k tenths of cloudiness.

The ${}_{\alpha}C_s$ matrix used for this paper is given in Table 1.

Table 1. Probabilities of Cloud-Free Lines-of-Sight as a Function of Elevation Angle and Observed Total Sky Cover in Tenths. This is the ${}_{\alpha}C_s$ Matrix

		Sky Cover (tenths)										
		<u>0</u>	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>	<u>7</u>	<u>8</u>	<u>9</u>	<u>10</u>
Elevation Angle (degrees)	90	1.00	0.97	0.92	0.87	0.81	0.77	0.70	0.62	0.48	0.31	0.08
	50	0.99	0.96	0.90	0.85	0.78	0.73	0.64	0.58	0.45	0.29	0.08
	30	0.98	0.93	0.86	0.80	0.73	0.66	0.57	0.50	0.38	0.24	0.06
	10	0.97	0.86	0.76	0.65	0.55	0.47	0.39	0.32	0.24	0.16	0.03

3. AN EXAMPLE

The climatic record of sky cover at Rhein-Main Apt, Frankfurt, Germany, shows that 0/10, 1/10, . . . , 9/10, and 10/10 sky cover was reported 6.0, 3.0, 0.7, 2.8, 3.6, 2.5, 4.7, 1.9, 6.5, 18.6, and 49.8 percent of the time, respectively, between 12-14 LST during January 1947 through 1970. Performing the matrix multiplication, we obtain:

1. Lund, I.A., and Shanklin, M.D. (1973) Universal methods for estimating probabilities of cloud-free lines-of-sight through the atmosphere, J. Appl. Meteorol. 12(No. 1):28-35.

$$\alpha \hat{P}_1 = \begin{bmatrix} 1.00 & 0.97 & \dots & 0.31 & 0.08 \\ 0.99 & . & & . & 0.08 \\ 0.98 & . & & . & 0.06 \\ 0.97 & . & & . & 0.03 \end{bmatrix} \begin{bmatrix} 0.060 \\ 0.030 \\ . \\ . \\ 0.186 \\ 0.498 \end{bmatrix} = \begin{bmatrix} 0.340 \\ 0.329 \\ 0.293 \\ 0.224 \end{bmatrix} \quad (2)$$

The computations show that there is about 34.0% probability of a CFLOS at Rhein-Main looking toward the zenith (90°), and a 32.9%, 29.3%, and 22.4% probability of a CFLOS at 50°, 30°, and 10°, respectively.

4. CFLOS PROBABILITIES BELOW 8200 ft (2500 m)

Estimates of CFLOS probabilities between the earth's surface and a height of 8200 ft requires knowledge of the distribution of cloud amount below 8200 ft. The standard synoptic cloud group, $N_h C_L h C_M C_H$, where N_h is the total amount of low clouds (N_h is reported in octas) or, in the absence of low clouds, the amount of middle clouds, and h is the height of the lowest cloud, is used to determine this distribution (h is reported according to WMO Code 1600). Each observation is checked to determine the height of the lowest cloud, h . If h is coded as 8 or less, the amount of cloud reported for N_h is determined. If h is 9, no clouds are present below 8200 ft. The resulting distribution of cloud amounts below the level of 8200 ft is multiplied by the $\alpha C'_s$ matrix to determine $\alpha \hat{P}'_1$, the probability of a CFLOS between the surface and 8200 ft.

$$\alpha \hat{P}'_1 = \alpha C'_s K'_1 \quad (3)$$

where $\alpha C'_s$ is the matrix given in Table 2 and the K'_1 column vector is the sky cover below 8200 ft in octas.

Table 2. Probabilities of Cloud-Free Lines-of-Sight as a Function of Elevation Angle and Observed Total Sky Cover, in Octas. This is the $\alpha C'_s$ Matrix

		Sky Cover (octas)								
		<u>0</u>	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>	<u>7</u>	<u>8</u>
Elevation Angle (degrees)	90	1.00	0.96	0.89	0.83	0.77	0.68	0.55	0.35	0.08
	50	0.99	0.94	0.87	0.81	0.73	0.63	0.52	0.33	0.08
	30	0.98	0.92	0.83	0.75	0.66	0.55	0.43	0.28	0.06
	10	0.97	0.84	0.72	0.58	0.47	0.38	0.28	0.17	0.03

5. THE STATIONS

Table 3 lists stations from which long records of hourly sky cover observations are available for at least part of the day. CFLOS probabilities were computed for these stations, which are shown in Figure 1.

6. THE MAPS

A total of 66 maps are included in this paper: one station locator map, Figure 1; one map for each of the four mid-season months (Jan-Apr-Jul-Oct), four 3-hour periods (00-02 LST, 06-08 LST, 12-14 LST, 18-20 LST), four elevation angles (10°, 30°, 50°, 90°), Figures 2 through 65; and a single map, Figure 66, depicting the extreme condition (the lowest probability for any of the above months and periods). In order to conserve space, the extreme condition is shown for the 30° elevation angle only.

All of the CFLOS probability values plotted on the maps below the station locations were computed as shown in Eq. (2); however, the gK_1 column vector was changed with every station, month, or 3-hour time period change. The values plotted above the station location were computed through the use of Eq. (3). They are estimates of the probabilities of a CFLOS between the earth's surface and an altitude of 8200 ft. CFLOS probabilities were not plotted on the maps unless they were based on at least 300 sky-cover observations. Most of the probabilities are based on more than 900 sky-cover observations.

Because of the small area covered by the map and the few locations considered, an analysis of the CFLOS probabilities was not performed.
